

Title: Bipolar Disorder, Neurological Challenges, and Self-Awareness: Bridging Science and Philosophy

Introduction

Bipolar disorder is not only a mental illness, but also a reflection of the inherent dualities of human existence. The oscillation between depression and mania reflects the tension between order and chaos, rationality and emotion. Neurological research highlights the role

of neurotransmitters and brain circuits, while philosophy interprets these oscillations as symbolic cycles of light and darkness. The aim of this proposal is to integrate scientific findings with philosophical perspectives to develop a comprehensive understanding of bipolar disorder and its impact on self-awareness

Research Objectives

- .To analyze the neural basis of bipolar disorder and its cognitive consequences -
- .To examine philosophical interpretations of duality and their relationship to mental health

To examine self-awareness as a mediator between scientific knowledge and existential meaning

Propose a framework that integrates medical treatment, philosophical reflection, and public health strategies

Research Questions

?How do neural mechanisms contribute to the development of bipolar disorder .

In what ways can philosophical concepts of duality enrich our understanding of mental ?illness

How does self-awareness serve as a bridge between scientific and philosophical .
?approaches

?What are the implications for public health and social perception of this integration .

Methodology

Scientific review: Analysis of recent studies on neurotransmitters, brain circuits, and -
.cognitive impairments in bipolar disorder

Philosophical analysis: Review of classical and modern philosophical texts on duality, -
.consciousness, and human struggle

Conceptual synthesis: Development of a hybrid model that integrates scientific and -
.philosophical insights

Public health perspective: Evaluation of strategies for awareness, stigma reduction, and -
.comprehensive care

Significance of the Study

This research contributes to science and philosophy by providing a multidimensional view of bipolar disorder. It emphasizes the importance of combining medical treatment with philosophical reflection and self-awareness. Such an integration could strengthen public health strategies, reduce stigma, and provide a deeper understanding of individuals' .condition
